

Name:

Cisín Argaud

$$\frac{46}{48} = 96\%$$

Question 1

- (a) Examine the aerial photograph below which shows the area around a town in Co. Cork and answer each of the following questions.

- (i) Is the river shown in the photograph in the upper or lower course?

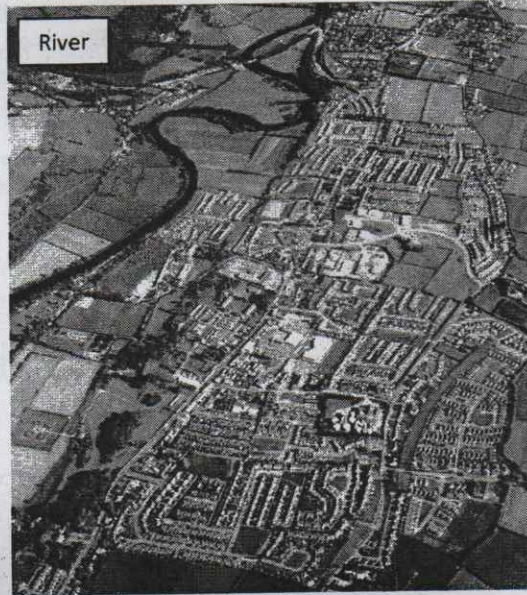

Tick (✓) the correct box.

Upper course ☐

Lower course ☒

- (ii) Name one river feature that can be seen in the photograph.

Meander 3

- (iii) Explain two reasons why towns often develop near rivers.

1. The valurium from the river is deposited in the area around it during floods, making the land fertile. Fertile land is easier to farm and towns then get built up around them farms.
2. People use water to hydrate themselves, their livestock and their crops. It is easy to get water from a river, so people live nearby and towns emerge.

18

Question 2

In the boxes provided, match each of the letters in **Column X** with the number of its pair in **Column Y**. One match has been completed for you.

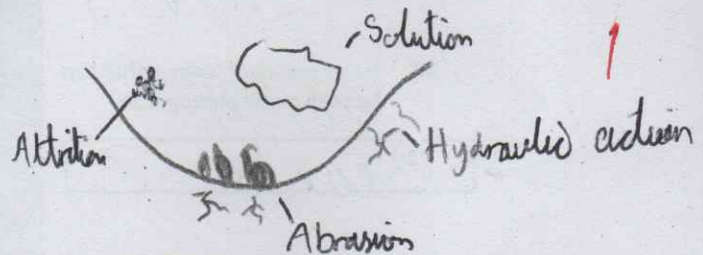

Column X	
A	Abrasion
B	Hydraulic Action
C	Solution
D	Attrition

Column Y	
1	Chemicals in water dissolving rocks.
2	Stones hitting off each other while being carried by the river.
3	The river's load hitting against the bed and the banks of the river.
4	The force of moving water.

X	Y
A	2
B	4
C	1
D	3

Question 3

10A. RIVERS

Amended from www.stuckiniceland.com

Circle the correct answer in each of the following statements.

- (i) The feature labelled X in the photograph above is called a rapid / waterfall.
- (ii) The feature labelled X is a feature of river erosion / river deposition.
- (iii) The feature labelled X is found in the upper / lower course of a river.

3

5

Question 4

10B. RIVERS

Complete each of the following sentences by inserting the correct term in each case.

- (i) The term given to an area drained by a river and its tributaries is known as the river

drainage basin

- (ii) The term given to fertile material deposited by a river on a flood plain is

alluvium

- (iii) Pronounced bends along the middle course of rivers are known as

meanders

3

Question 5

8B. RIVERS

Circle the correct answer in each of the statements below.

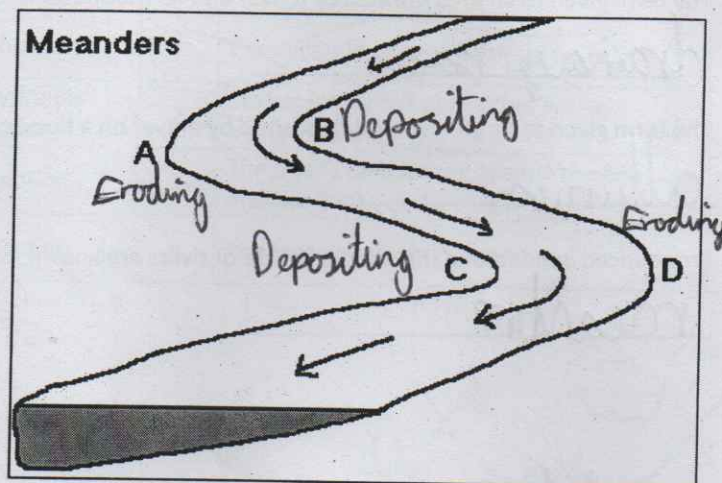

- (i) The river feature shown in the photograph above is a ~~delta~~ V-shaped valley.
- (ii) This feature is found in the upper / lower course of a river.
- (iii) It was formed by the process of river erosion / deposition.

3

Question 6

3. RIVER EROSION AND DEPOSITION

The diagram shows river meanders. The statements below refer to the diagram. One of the statements is correct. Tick (✓) the box opposite the correct statement.

The river is:

- (i) Eroding at B and depositing at A ☐
- (ii) Eroding at B and depositing at C ☐
- (iii) Eroding at A and depositing at C ☒
- (iv) Eroding at C and depositing at D ☐

3

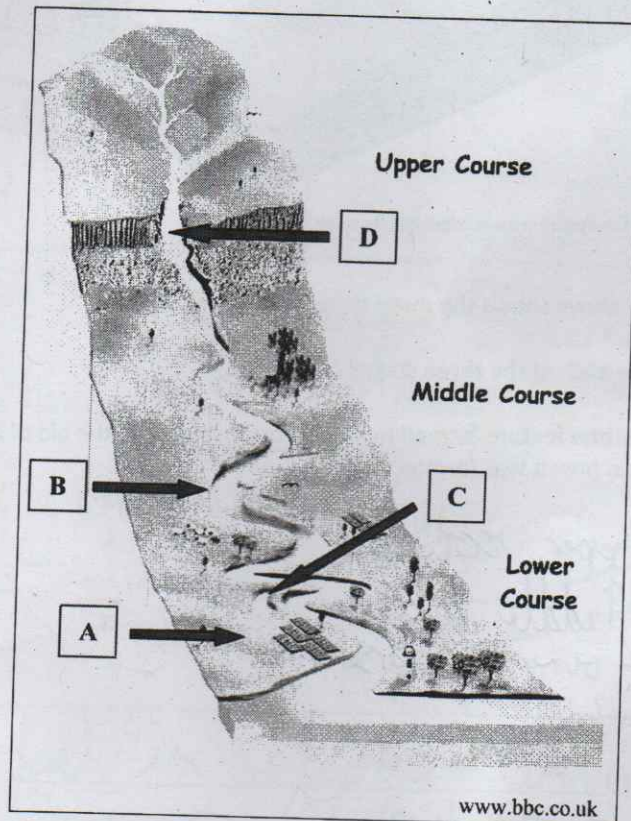

Question 7

8. RIVERS

The diagram below shows the **course** of a river.

Give the **correct location** for each of the river features shown on the diagram, by writing the correct letter beside each feature named in the table below.

One pair has been completed for you.

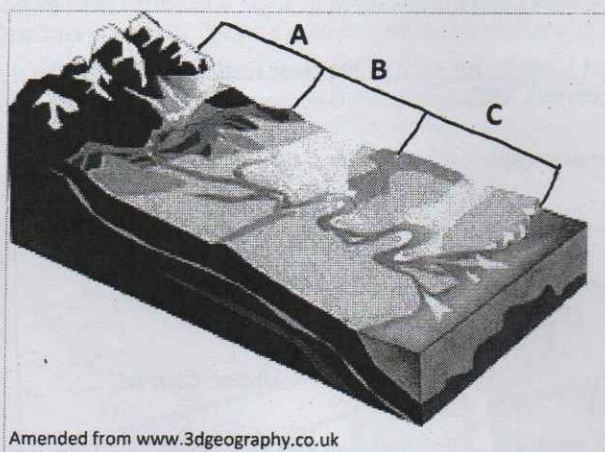

Feature	Letter
Meander	B
Oxbow lake	C
Waterfall	D
Floodplain	A

3

Question 8

A. Rivers

The diagram above shows the three stages of a river.

- (i) Name each of the three stages A, B and C.
- (ii) Name **one** feature formed by river erosion and, with the aid of a labelled diagram, explain how it was formed.

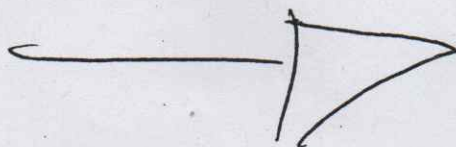

(12)

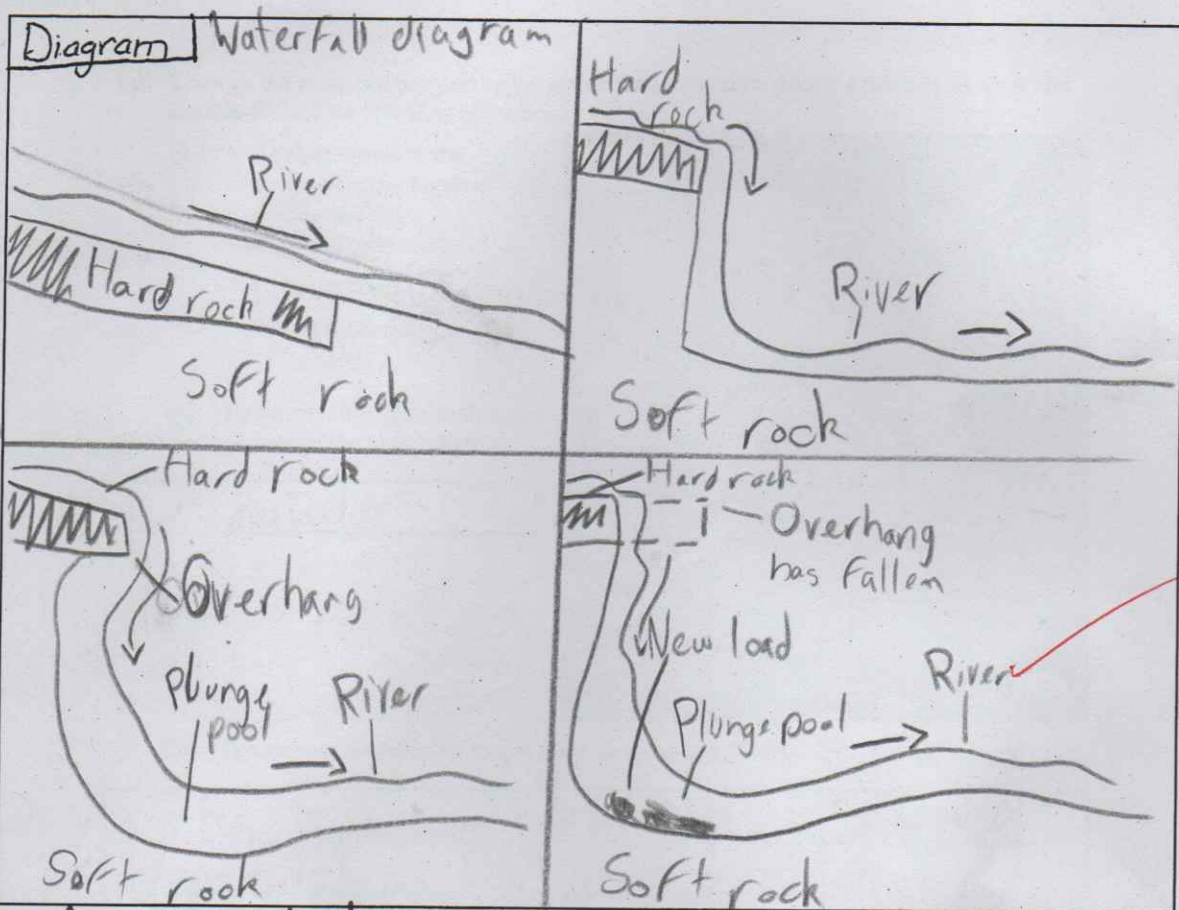

i A: Upper course
B: Middle course
C: Lower course

Answer on

next page

A waterfall is a feature in a river caused by erosion. It happens when a river that was flowing over hard rock flows over soft rock. The soft rock erodes faster and eventually the erosion leads to a drop. More erosion causes an overhang of the hard rock and a plunge pool at the bottom where the water falls. Eventually, the overhang hangs out so much that it falls into the river and becomes part of its load. Waterfalls form in the upper course of a river because there is more rock there. As a waterfall is a drop in a river's course, the water falls, giving it its name.
